

Written Calculation Policy—Division

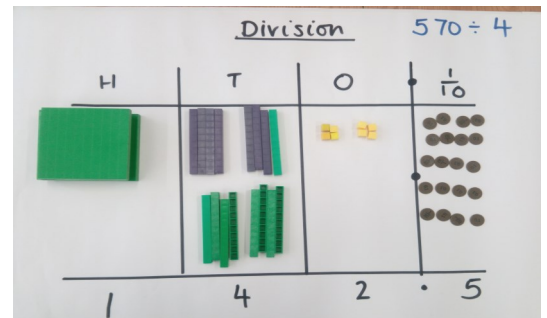

1. Lay out the dividend in Diennes on a place value chart as shown.

2. Starting at the hundreds, make groups of the divisor and regroup and remainders into the next column down. E.g. $500 \div 4 = 100 \text{ r } 100$ so regroup the 100 into 10×10 .

3. Repeat, using tenths/ hundredths counters if required.

Division $570 \div 4$

$4 \overline{) 570.0}$

142.5

Start from the LEFT
Regroup from the LEFT

Use the pictorial alongside the formal method to bridge children's understanding of how the formal method works.
